

SAWDUST

BY KLINGSPOR'S WOODWORKING SHOP OF HICKORY

Hickory's New 20,000 sq ft Superstore Unveiling & Sale Event-

Friday May 3rd • 9:00 am - 6:00 pm

Saturday May 4th • 9:00 am - 5:00 pm

(Event activities will take place from 9:00 am - 3:00 pm both days)

Same Location Larger Selection

For those who haven't heard, the Hickory store has expanded...a lot. What started as a small mail-order catalog company in the late 80s has now fully opened not only North Carolina's, but one of the southeast's (maybe the country's) largest fully loaded woodworking supply stores.

The word "superstore" implies a certain connotation, and our newly renovated headquarters will not disappoint. With over 20,000 square feet of floor space for showcasing our vast assortment of products, two classrooms, and demo area, this superstore showroom puts all the woodworking eye candy on display.

- Door prizes, giveaways, sale prices
 - Free demonstrations, and an opportunity to participate in scroll sawing, pyrography, woodturning, marquetry, and CNC
 - Enter to win a **\$500 gift certificate** from Klingspor's Woodworking Shop
 - Demos by: NCWoodworker.net, Catawba Valley Woodcarvers, NC Woodturners Assoc, Western Piedmont Woodcrafters, Marquetarians of the Carolinas, and Southeastern Pyrography Assoc
- Also, Kevin Bedgood from Robert Sorby will be doing demos both days!
- **1st 50 customers through the door each day will receive a great Door Prize - sponsored by Klingspor Abrasives (Hickory store location only)**

Tech Time - Contour Sanding

In previous editions, we looked at some smaller options for detail sanding that we offer. Today, we will look at our sanding mops and sanding stars, which are better suited for medium to larger contoured pieces. They each offer various benefits depending on the sanding needs but are assembled and approach the task slightly differently, and offer additional accessory options. Both are made with premium Aluminum Oxide grain on a super flexible J-flex cloth material coated with KLINGSPOR's proprietary multi-bond lubricant.

First, let's look at the Sanding mops. The sanding mops are available in both 4" and 6" diameter options and are cut into strips 1" or 2" in width, based on the specific mop. The strips are perforated with small slits on the end and have a 1/2" hole in the center for stacking back to back on the mandrel. Once you install one pair onto the mandrel, you install the next pair in a crisscross manner. You continue this process until the desired number of strips (thickness) is achieved. As you install the strips, the mops can be made more "fluffy" by adding spacers at random intervals. The final thickness of the mop will be determined by your needs and the specific mandrel you are using. You are only limited by the mandrel length. When a mop wears out, you simply buy refills to replace them and start the process all over again.

Since mops require a mandrel to load them on. We offer them a variety of mandrel sizes and orientation options. We also offer an assortment of accessories like spacers and flanges to change how the mops will impact the aggression and approach to the workpiece. A full video on loading the mops, available accessories, and configurations can be found on our website or YouTube channel or scan the QR code on this page.

Sanding Stars, on the other hand, are pre-loaded onto a mandrel and can't be reloaded. When a star wears out, you toss it (or save it for smaller parts) and grab a new one. Stars are also only available in 4" diameter and when "fluffed" up are approximately 5/8-3/4" thick. These are a great option if you are trying to decide if mops will work for you. I personally use the stars as

a primary option in my own shop. The stars are mounted in such a way that the side opposite the mandrel is flat, so you can get into tighter areas than a fully assembled sanding mop on a standard mandrel

So, how does it work? As the strips are broken in, they separate at the perforation and will gently follow the contour of the part being sanded. This makes the mops the ideal sanding solution for nearly all irregular surfaces and shapes that require sanding. This would be great, but not limited to moldings, door profiles, carvings, turned parts like legs and bowls, and the list goes on. They even make great metal cleaners and polishers for things like grill grates, stainless steel parts, and automotive part clean-up. If you sand anything with odd shapes or surfaces, give the Sanding Mops or Stars a try... you won't be disappointed.

Both are made with premium Aluminum Oxide grain on a super flexible J-flex cloth material coated with KLINGSPOR's proprietary multi-bond lubricant.

The benefit of Klingspor's LS312 material for mops is that the super flexibility and the combination of semi-open coat grain and the multi-bond lubricant make it nearly impossible to load, which makes this material the perfect choice for irregular surface sanding.

Tips for Sanding Mop Set Up & Use

- Place two sheets back to back, see Fig. A
- Crisscross sheets to form a wheel, see Fig. B and Fig. C.
- Repeat the pattern until you have 15 to 20 sheets on the arbor, then tighten the nut to hold sheets together.
- Secure the assembly in your drill press, hand held drill, lathe, etc. Be sure to tighten the chuck adequately. Operate at a maximum speed of 2300 RPM, and we strongly suggest you DO NOT exceed this speed.
- Before using the sanding mop on your project, break in the edge by holding a piece of scrap hardwood against it as it spins. This will "soften" the edge so that it doesn't gouge your work.

Customer Spotlight - Charlie Brown

The customer spotlight in this issue has been "spotlighted" before. Some of his work was recently featured on the front of one of our catalogs. He has been woodworking since he was a young man watching his dad work wood as a carpenter at Fort Bragg after World War II. He began by making simple toys from saplings using his dad's hand tools and now does incredible furniture and Marquetry. Meet Charlie Brown.

Q. What is your favorite product to use from Klingspor's Woodworking Shop

A. Klingspor's inventory is gigantic, especially since the Hickory store has doubled in size. I particularly like the large selection of finishes and sanding supplies. The wipe on polyurethane is my favorite and the box of sandpaper cutoffs is always on my list when browsing. The selection of wood, both domestic and exotic, has increased significantly since the store has been remodeled and prices are very reasonable.

Q. What is the most challenging project?

A. Probably, the most challenging project I have attempted was a Roubo workbench I built several years ago. The table top has sliding dovetail leg connections and pegged leg bracing. Construction required all the joinery to be connected simultaneously. Some of the surfaces were glued or epoxied and I can now affirm the validity of the adage "One Never Have Too Many Clamps". I am also a believer in delayed setting adhesives. The project came together but not without considerable effort.

Q. What is your favorite project?

A. My favorite project and the one I take the most satisfaction in is the Federal Period side table pictured below. It was a project I really enjoyed doing for several reasons. It incorporated joinery, marquetry, inlays, and finishing that really produced a nice-looking, functional table.

Q. What tips can you share with us?

A. A couple of tips come to mind that may be of use to my fellow woodworkers.

- Listen to and question other woodworkers that you admire and respect. They have your admiration for good reason. Put their experience to work for you and share what you glean with others.
- Don't neglect air quality in your shop. My dad suffered from respiratory problems for a long time. It's something I think about often.

Q. How did you get into woodworking?

A. I started making sawdust seriously after my wife and I started a family and bought our first house. There was always a need for cabinets, shelving, toys, etc., and I started making a few pieces of furniture. I also built my first backyard workshop and began buying a few power tools. Combined with the tools Dad left me, I had a fairly functional small shop. After our move to Hickory over fifteen years ago, I immediately became involved in several of the woodworking clubs and served on several club boards. Most of the friends I have today are woodworkers I met on Saturdays at Klingspor's Woodworking Shop.

Q. What are your top 5 most tools used?

A. The tools I use most have to be the table saw, bandsaw, router table, planer and hand tools. I still get an immense amount of satisfaction in making tools and jigs and moving things around in the shop to make work easier and more efficient.

Q. What would you like to try next?

A. Next on my list is an office desk. The one I am currently using has a built-in recess for a monitor and other hardware. My new equipment doesn't fit as well as I would like so, a new project is born.

Q. How does the typical day start for you in the shop?

A. I am seldom without a project in the shop and am an early riser so I'm usually in the shop by 8:00 or so. Typically, I have a sketch or idea jotted down from a day or two before I start. That way, if you're OCD like me, you get to spend most of the night before thinking about what you missed or think you should change. This also allows me to gather materials for the project so that once the project is underway, I can proceed without interruption. Ideas for projects come from many sources. My wife is seldom without a request for something for the house or our kids or grandchildren. Woodworking clubs typically have a portion of the monthly meeting dedicated to "Show and Tell". This is a great opportunity to see what others are creating and to ask questions about how the project was made and tips for making one yourself. Some of my most recent projects include wooden recipe boxes, basement shelving and drawers, marquetry pictures, and a small side table.

Vendor Spotlight - Arbortech

Today's vendor spotlight focuses on a small but worldwide company. For those who are into power carving, they will be well-known. They are famous for their 4-1/2" angle grinder attachments and high-quality cutters. We recently partnered with them for the Carve It Up USA competition for our Woodworking Extravaganza. Meet Arbortech.

Q. How did your company get started?

A. Arbortech Tools was started by Kevin Inskter in Perth, Australia over 35 years ago. Kevin was commissioned to carve some chairs out of logs and needed a faster way. He invented the Industrial Woodcarver for this purpose, and it has led to additional tools and attachments.

Q. Has your company evolved into new product types from how it got started?

A. Absolutely. The Turbo Plane is a result of hours of use with the Industrial Woodcarver and the desire to cut on the face of the disc rather than the outside edge. The Mini Turbo and Turbo Shaft are children of the Turbo Plane. The Ball Gouge led to the smaller Precision Carving System. Arbortech continues to evolve to this day.

Q. What is your bestselling product or what is your company most known for?

A. The Ball Gouge and the Turbo Plane are our top sellers. Arbortech is most known for the Turbo Plane.

Q. What is the most surprising item that has sold well?

A. The Allsaw was originally designed as a tree-cutting tool in Western Australia. It turned out to be a great match for removing mortar and other commercial US applications.

Q. Additional information you would like to share with our readers about your company.

A. We are currently launching new products on both sides of our business. We are launching the Turbo Scraper as our newest power carving attachment. It is a great alternative to a burr disc as it creates less dust and leaves a really smooth finish while allowing for precision control. We are also launching a new model of the Allsaw, the AS200X, which has been greatly improved with our new quick-change blade system.

Product Spotlight

Sawstop Scale Miter Gauge

Bring can't-miss accuracy to your table saw with the Scale Miter Gauge, featuring 180 precise locked-in angles, an extendable fence, and a micro-adjustable dual-arm flip stop. The miter head features a pointer and 90 notches in 1° increments on each side of 0°, including one for 22.5° on each side. A Vernier scale lets you fine-tune any angle in 1/10° increments. An 18"-long miter bar uses six adjustable washers to eliminate movement in the miter slot while ensuring a smooth glide forward and back. The aluminum fence provides a large reference for workpieces, with a telescoping extension that reaches up to 31" with the flip stop. The scale on top of the fence can be calibrated to enable precise crosscuts without having to measure and mark your boards. Use the flip stop to make repeated cuts at the same setting for identical project parts. The flip stop indexes on the fence in 1/32" increments. The flip stop's dual arms can be set independently at different lengths from the blade or linked together, all of which can be fine-tuned with a micro-adjuster.

Gränsfors Bruk Axes

The Carpenter's Axe has a long, thin and straight edge with a straight bevel face and a narrower poll, giving an even cutting surface for great carving. The forged inward curve from the heel to the lip of the head allows your hand to grip almost straight above the centre of the cutting edge, which is important when your work requires stability and precision. The handle is straight to suit all grips. Its flat, straight shape makes this axe suitable for work in dry wood. Includes a sheath.

CARPENTER'S AXE **GFB4650** **\$223.00**

The Large Swedish Carving Axe is used for woodworking and shaping wood. The axe has been developed in collaboration with master craftsmen Wille Sundqvist and Onni Linnanheimo, with inspiration from old designs. The Large Carving Axe has a relatively long, curved cutting edge which is double-sided as standard. The axe is also available with the edge ground specifically for right-handed or left-handed carving giving even better grip and control. Includes a sheath.

CARVING AXE DOUBLE BEVEL
GFB4751 **\$264.00**

The Broad Axe model 1900 has a traditional design and is suitable for squaring logs and planks, for example when building a log house. As a rule, the Broad Axe is ground on both sides of the edge (knife grind). The double-sided Broad Axe is often used for making joints, but also for all sorts of timber and plank hewing. Includes a sheath.

BROAD AXE 1900 STRAIGHT HANDLE DOUBLE BEVEL
GFB4801 **\$380.00**

The Froe is used to split wood very finely, for example when making shingles for a roof. The wood to be split is placed under the edge. The user steadies the tool with one hand on the vertical handle and strikes the blade with a mallet using the other hand. The handle is removable, making the Froe easy to transport.

FROE **GFB4870** **\$230.00**

Employee Spotlight - Jack Hastings

Our stores are a valuable resource for woodworking knowledge. Today's employee spotlight is no different. He has been an asset to our Asheville location for over nine years and is a wealth of information regarding guitar-making, sharpening, general woodworking, and spray finishing. Meet our Asheville store manager, Jack Hastings.

Q. If you were to change one thing about your job, what would it be?

A. I would love to have time to teach more classes on turning and sharpening

Q. Where do you see yourself in 1 year?

A. Right here

Q. Where do you see yourself in 5 years?

A. Making guitars in my shop full time.

Q. Is the job what you expected it would be?

A. I didn't really have many expectations, but the results of helping customers learn or solve a problem is very rewarding.

Q. Do you have a craft or hobby that uses KWS products?

A. Absolutely. I was a customer for over ten years before coming to work here. I used the abrasives on my Windsor chairs and guitars. I built over 100 chairs shipped all over the U.S. I am currently working on guitars #63 and #64. My guitars have been shipped around the world.

Q. What's your favorite KWS product / Or thing about working for KWS?

A. One of my favorite things about working for KWS is helping customers solve problems.

Club Central - Western North Carolina Woodworkers Association

In this edition of our club spotlight, we travel to Asheville, NC, where we take a look at a club that focuses on general woodworking applications. They have been meeting since 2006 and at one point met in our Asheville store until their numbers exceeded what the store could accommodate. Meet Western North Carolina Woodworkers Association (WNCWA).

Q. Tell us more about your club...

A. In addition to holding meetings and plant tours, we are starting workshops at member's shops. Topics planned for this year are: table saw alignment, bandsaw alignment and blade setup, and sharpening methods. These workshops will be hands on so all members can learn "how to" in a shop. We want to grow the club's membership and learn from each other's woodworking skills.

Q. What are the meeting times and location?

A. We meet at the Trinity View Retirement Community on the 2nd Saturday of each month at 9:30-1:00. The address is 2533 Hendersonville Rd, Arden, NC 28704 Our Website is: www.wncwa.net

Q. Are there any special charities or fundraisers the club is a part of?

A. We donated wood and labor to build 100' long hoop houses for Asheville Greenworks, we put on kids workshops via Boys & Girls clubs, and hold an annual silent auction to raise money to support area needs and groups.

Q. Who was the most fascinating guest/demonstrator you can recall having a demo at your club?

A. Guest speakers have included: Brian Boggs (custom chair builder), Andy Rae (furniture maker & author), Greg Paolini (arts & crafts furniture maker) and Chris Smith (Klingspor Technical Support). We also held field trips to a local plywood plant, Cor Mark Int. a local wood supplier and other member's workshops.

In the fourth and final installment of our tips on "Burning a Signature," we consider the importance of... Burn Slow and Steady

In addition to the setting on the temperature dial, how fast or slow you burn determines

the color of the burn. If you burn very fast, the burn will be very light in color because any given point on the burn line does not have enough burn time to get dark. Most adults have a tempo when writing their signature—usually starting out slower and then quickly speeding up before the end. When burning a signature using this tempo, the result is a name that starts out dark and ends too light. The solution is to burn

using the same speed throughout the signature. Until this becomes second nature, try writing the signature in pencil and trace it like a pattern, concentrating on keeping the speed the same throughout the signature.
